

BUCKS in ACTION

Sugar Maple

This is a Sugar Maple. I have collected a leaf of it. Its leaves have 5 points, and are currently green. This plant is known for its sap which is used to make maple syrup. Fun fact: Canada has a Sugar Maple leaf in its flag. Its leaves are green currently, but they turn red in autumn.

“As the school year comes to a close, the honors biology students are thrilled to introduce their Diversity of Life Collections. This exciting project allowed them to explore and collect evidence from various species studied throughout the school year. Students were tasked with creating both an artifact specimen collection and a Google Slideshow, with a minimum of 40 different species from the 180 species they learned this school year. Students found everything from footprints to leaf impressions, the project encouraged creativity and hands-on learning. Students were reminded to be mindful of protected and endangered species, and that the artifacts were not to be roadkill. Each artifact was to be accompanied by a photo of their Flat Stanley, along with a typed description answering key questions about the species. The Google Slideshows students made mirrored their artifact collections, detailing each species' significance within its ecosystem. The honors biology students had a blast delving into the world of diverse life forms around us while creating lifelong memories! Go Bucks!” - Melissa Frost, BHS Biology Teacher
